This QI project is designed to improve provider screening for social and emotional drivers of health in children under the age of 5. Through collaboration, providers treating children will work together to improve screening, management and referral processes. Screening will be done using a family centered and strength-based approach through a trauma-informed lens. Participants will be working with a QI Coach for guided improvement work.

Participants must:
- Be a pediatrician, pediatric/family practitioner, nurse practitioners or PA who works with children under age 5 in the outpatient setting
- Participate in monthly, virtual lunchtime learning collaborative calls occurring May-November 2022 from 12:30-1:30pm
- Upload data every month of the project regarding screening for children seen for well visits
- Participate in brief surveys before and upon completion of project

Webinars will:
- Feature expert speakers and education around implementing SDOH and SE screenings
- Teach you how to develop a trauma-informed lens and support children who have suffered from trauma such as food insecurity, physical abuse, etc.
- Share critical resources such as the AAP Screen & Intervene Toolkit and the Bridge2ResourcesVA platform, a free social needs resource directory
- Help you to conduct billing/coding around screenings

This project is particularly timely given the effects we are seeing on young children from the covid-19 pandemic.

Register By April 18th, at vmap.org/qi or email Jane Chappell, VA-AAP Grant Manager, at jchappell@ramdocs.org.
